

MQPERF1

Introduction to MQ SMF-Task and Channel Accounting Records

Agenda

- The Trident of record Types
 - No Aquaman jokes
- The Task report
 - It's a detailed baby

MQ Accounting – The home of the devil

- The SMF 116 data is the task related data produced by an IBM MQ for z/OS queue manager.
 - Very detailed
 - Often necessary to track down performance problems
 - Costs vary by:
 - Application Style
 - SMF production type (MAN datasets or Logstreams)
 - Recently seen some examples of there being little to no overhead for collection and production of the data
 - Standard estimates are between 3-7% overhead

MQ Task Accounting

- These detailed records are actually made up of three components:
 - WTID the Task Identifying Information
 - WTAS The Task Statistics
 - WQ the Queue Use data

WTID - What's in it

- The connection type:
 - CICS
 - Batch
 - IMS
 - CHIN
- Connection Name
 - The job name, can be the CICS region name, etc.
- Operator ID User ID used by the task
- Correlator
 - For CICS transactions, this includes the Transaction ID and the Task identifier

WTAS – What's in it?

- This contains information that is task related, but not specific to a queue accessed by the task
- Latches: 0-31
 - MQ must serialize requests to some resources and uses latches to maintain that serialization
 - Extremely log latches can indicate problems with underlying resources or internal contention
 - Some latching is normal
 - But if they start becoming too long, time to look closer
 - (and we've seen some interesting things
- Longest latch elapsed time, latch type of the longest latch
- Other Requests Number, CPU Time, Elapsed Time
 - These fields cover the requests that are not reflected in the queue level accounting data
 - This includes the costs associated with queues that are set to not collect the queue level data

WTAS – What's in it? - continued

- Commits Number, CPU Time, Elapsed Time
- Backouts Number, CPU Time, Elapsed Time
- Unforced Log Writes Number, CPU Time, Elapsed Time
- Forced Log Writes Number, CPU Time, Elapsed Time
-and many more a lot having to do with CF, SMDS, and Db2

Queue accounting – known as the Queue Statistics

- Lots of very interesting info in this one
- Open Name the name used for the MQOPEN
- Base Name the resolved queue name
 - Might be an XMITQ, etc.
- Queue Type Local, Model, etc.
- Index Type Message ID, correlation ID, etc.
- QSG Disposition Shared, etc.

Queue accounting – known as the Queue Statistics

- MQ API information
 - Collected for all the API types for the queue
 - Number of requests
 - CPU total
 - Elapsed Time total
 - Special for MQGET (not every field but highlights):
 - Counts for the varieties of MQGETs
 - Invalid GET count
 - Number of pageset reads to fulfill an MQGET
 - Skipped messages
 - Expired messages
 - Valid MQGETs (returned data)
 - Number of bytes put
 - Max & Min Message sizes
 - Longest & shortest time on queue for retrieved message
 - Number of persistent messages retrieved
 - Maximum Queue depth

Queue accounting – known as the Queue Statistics

- MQ API information
 - Special for MQPUT & MQPUT1 (not every field but highlights):
 - Put to waiting getter count
 - Pageset activity
 - Number of bytes PUT
 - Valid puts
 - Generated Message count
 - Max & Min message Sizes
 - Number of persistent messages put (or put1)
 - Maximum queue depth
 - Number of messages published to a topic
 - Count of messages to a shared queue
 - Count of messages to the IGQ
 - Location information
 - CF Structure, pageset and bufferpool data

Sample Task Output

Summary

- The tasks records contain a great deal of detailed information about the use of queue managers and queues.
- MP1B gives and very nice formatted view of the individual tasks, which can be helpful when looking problems.
- Learning to look at this data is not fun.
